Creation of POLI-LAB – a modern research laboratory

With the beginning of the year, we have opened a specialized laboratory, distinguished by modern equipment allowing for a wide range of measurements and research. The laboratory has been equipped with devices such as moisture analyzer, a plastometer, a testing machine, an octagon, a spectrophotometer or Dart Drop.

All purchased devices allow you to control the quality of deliveries, monitor current production in order to maintain it at a constant, highest level and allow you to carry out work on the introduction of new products.
